

Friday — End-to-End Testing Guide

How to configure and verify every delivered feature · live target: `ai.randompack.com`

Friday is an enterprise agentic-orchestration framework: AI agents are first-class actors that run governed, audited, durable work. This guide is for **testing** what's been delivered — each feature has **What it is**, **How to test**, and **Expected result**. You work in two places:

- **Desk** (`/app` , log in as Administrator) — configure agents, providers, cron jobs, roles, Slack.
- **Raven** (`/raven`) — chat with and control agents. The primary "talk to your agents like coworkers" surface.

0 · Prerequisites (one-time)

On the live AWS box these are already set; check them in Desk if anything misbehaves.

Prereq	Where (Desk)	Why
LLM provider + key	LLM Provider → one Active row (MiniMax)	No agent thinks without it
An active agent	Agent Profile → ≥1 Active Orchestrator	The thing you talk to
Raven provisioned	Raven Bot "Friday" + a War Room channel	The chat surface
Your roles	User → you → Roles	Friday Operator (commands) + Friday Cron Manager (cron)

Migrate after deploy: stop the stack, run `bench --site <site> migrate clean`, restart. The migrate seeds new roles but leaves them *unassigned* — grant **Friday Operator** + **Friday Cron Manager** to your account or commands/cron are refused.

1 · Talk to an agent core

What: message the Friday bot in Raven; it answers as a real governed agent (thinks, uses tools, replies).

Test: open a DM with **Friday** → "What can you help me with?"

Expect: a real reply authored by the agent. This is the foundation everything rides on.

2 · Run real project work

What: agents create Projects + Tasks, run a durable pipeline (dispatch → run → auto-heal), and produce downloadable deliverables (Markdown + PDF).

Test: ask an Orchestrator "Draft a one-page brief on X and save it." Watch Desk: Task list + the Task Pipeline Kanban.

Expect: Tasks move Pending → Assigned → Executing → Completed; a finished task attaches real deliverable files.

3 · The human-approval gate — from chat governance

What: a risky action pauses and waits for a human; you approve/deny from Raven.

Test: when an agent hits a gated action it posts that it needs approval (a Workflow Request goes Pending). Type /approve (or /approve <id>), or /deny too risky .

Expect: /approve flips the request to Approved **and resumes the paused work**; /deny rejects + records the reason. (AWS-verified.)

4 · Control a running agent — slash commands

/status and /help are open to anyone; the rest need Friday Operator.

Command	Does	Expect
/help	List commands	Bot posts the list
/status	This channel's state	"N pending approval(s)"
/approve · /deny	The gate (§3)	Resumes / rejects
/stop	Interrupt the turn + its delegated work	"🛑 Stopping this turn and N delegated task(s)"
/stop force	Hard-kill a wedged turn now	"💀 Force-killed: N job(s) cancelled"; tasks → ForceKilled
/steer <text>	Nudge a running turn without stopping it	Agent adapts on its next step

Not a bug: /stop and /steer take effect at the agent's *next thinking step* (after its current model call), not mid-sentence. Use /stop force only when a turn is wedged inside one long operation. A plain message sent while busy *queues* — only the commands interrupt.

5 · Scheduled agent runs — Cron Jobs

What: "run agent X with prompt P on schedule S, deliver result to T." A scheduled run is a normal durable Task underneath.

Test (Desk): new Cron Job → an Agent Profile, prompt "Summarise today's completed tasks", Schedule Kind=interval, Schedule Expression=1 (every minute), Deliver To=local .

Expect: within a minute a Task spawns + runs; the result is saved as a private File (open via the job's Last Task). Switch Deliver To to `raven:<channel-id>` → it posts into that channel. Repeat Times=1 → auto-disables after one run.

Heads-up: results aren't visible until ≥ 1 scheduler minute passes — don't read too early.

5b · Agents schedule their own work NEW

Test (Raven): ask an agent "schedule a job to post a status summary into this channel every 2 minutes." Then "list my scheduled jobs" and "pause/remove that job."

Expect: the agent uses the `manage-cron-jobs` skill → a Cron Job appears owned by that agent, delivering to the channel; within the interval the summary posts. An agent can only manage its *own* jobs.

6 · Search past conversations — session_search NEW

What: a long-lived agent can search its own past Chat Message history by full text — "what did we decide about X last week?"

Test (Raven): after some conversation, ask the agent "search our past messages for <a keyword you used earlier>."

Expect: the agent calls `session_search` and returns ranked past messages (content + session + time). Scoped to that agent's own messages only.

7 · Second chat surface — Slack NEW

What: Friday on Slack too — a thin adapter writing the same Chat Message rows as Raven. Proves the gateway is multi-surface.

Setup (one-time, external):

- Create a Slack app; add a **bot token** (`xoxb-...`) + the **signing secret** to **Slack Config** in Desk; set `bot_user_id` + `default_agent_profile` ; enable.
- Point the app's Event Subscriptions request URL at:

```
https://ai.randompack.com/api/method/
frappe.friday_core.surfaces.slack_adapter.receive_event
```

Subscribe to `message.im` and `app_mention` .

Test: DM the Slack bot, or `@mention` it in a channel; try `/help` and `/approve` there too.

Expect: the bot replies in Slack exactly like Raven; slash commands work; the request signature is verified (a forged request is rejected).

Quick-start E2E checklist

Run in order on `ai.randompack.com` (as Administrator, with the two Friday roles granted):

#	Step	Pass?
1	DM Friday in Raven → get a reply (§1)	☐
2	<code>/help</code> in a channel → bot lists commands (§4)	☐
3	Ask for a multi-step job → Tasks complete + a deliverable attaches (§2)	☐
4	Trigger an approval gate → <code>/approve</code> → paused work resumes (§3)	☐
5	During a long run: <code>/steer use the staging data</code> → adapts; <code>/stop</code> → ends (§4)	☐
6	Long wedged run: <code>/stop force</code> → "N job(s) cancelled", tasks → ForceKilled (§4)	☐
7	Create a Cron Job (interval 1, deliver local) → a result File appears within a minute (§5)	☐
8	Ask an agent to schedule a recurring job → it posts on schedule (§5b)	☐
9	Ask an agent to search past messages → ranked hits (§6)	☐
10	(If Slack configured) DM/@mention the Slack bot → replies + commands work (§7)	☐

What's NOT in scope yet (set expectations)

- **A2A** (agent-to-agent protocol) — deferred.
- **External memory providers** (Mem0) — deferred; first-party pgvector covers semantic recall.
- **Lifecycle-hook plugins** — deliberately not built (Friday already emits lifecycle events internally).
- **Polish**: live token streaming, per-surface display tiers, out-of-turn transcript mirroring.

The Hermes → Friday port is complete: every functional capability is shipped and on `main`. The items above are justified deferrals or polish, not gaps.
